

ABSTRACT

A method for forwarding an e-mail message from a disfavored e-mail address to a forwarding e-mail address via a remote e-mail forwarding computer having a unique e-mail address. An e-mail message is sent from a user to the remote e-mail forwarding computer. The remote e-mail forwarding computer parses the intended e-mail address from the e-mail message to determine if there is a disfavored e-mail address associated with the intended e-mail address. The e-mail message is sent from the remote computer to the computers associated with the forwarding address[es] if there is determined at least one disfavored e-mail address is associated with the intended e-mail address.
